Job Application for the role of Software Development Engineer - Intern

Dear sir or madam,

Amazon has been taking over the world with technologies the world could not have possibly imagined 10 years ago. Amazon.com, AWS and Kindle just mark the creamy layer of the best services and products that have made the lives of millions of individuals and businesses easier and better; And being able to contribute to such a platform not only makes me excited, it comes with the assurance of knowing I'd be working with some of the best engineers in the world and would provide endless opportunities to learn and improve my skills as a Computer Science major.

I've completed one Engineering internship, and was offered a full-time position by the company's VP for my addicition to getting the work done. I am devoted to the field of Computer Science and have been exploring several fields over the last couple of years. Recently, I've narrowed down my research interests to Natural Language Processing (NLP), Image Processing (IP) and Machine Learning (ML). I am sufficiently proficient with several front-end and back-end technologies, and open to work on either end of the spectrum. I have expanded my rhetorical skills greatly over the past years thanks to a fair level of public speaking during my intership and my tenure as a governer at my college's literary society.

I am a conscientious person who believes in hard work and attention to detail. I thoroughly enjoy working with a team, as it helps expand my thinking capabilities and ideas. I'm flexible and usually quick to pick up new skills. Thanks to the brilliant work culture currently instilled at Amazon, I believe I will be able to work at maximum efficiency and make more than satisfactory contributions to the project(s) allotted.

I look forward to speaking with you in further detail about the internship and opportunity with Amazon. I hope I'll get the chance to show you more of my abilities once I join your team.

Sincerely,

R Naresh
